                                                                                                                                                                                                                        DISEASE: DEFECTS IN MYOC ARE A CAUSE OF THE PRIMARY OPEN ANGLE GLAUCOMA (POAG). POAG IS SUBDIVIDED INTO TWO DIFFERENT CATEGORIES DEPENDING ON THE AGE OF ONSET: JUVENILE ONSET OPEN ANGLE GLAUCOMA (JOAG OR GLC1A) AND CHRONIC OPEN ANGLE GLAUCOMA (COAG) WHICH IS LATER IN ONSET. POAG IS A HIGHLY PREVALENT CAUSE OF IRREVERSIBLE BLINDNESS. IT IS CHARACTERIZED BY CUPPING OF THE OPTIC DISK AND ALTERATION OF THE VISUAL FIELD. BLEVATION OF INTRACCULAR PRESSURE IS OFTEN PRESENT AND IS A MAJOR RISK FACTOR. THE DISEASE IS PAINLESS AND OFTEN DIAGNOSED AT A LATE STAGE, WHEN VISUAL FIELD.
                                                                                                                                                                                                                                                                                                                                                                                                                                         TISSUE SPECIFICITY: EXPRESSED IN LARGE AMOUNTS IN VARIOUS TYPES OF MUSCLE, CILLARY BODY, PAPILLARY SPHINCTER, SKELETAL MUSCLE, HEART AND OTHER TISSUES. EXPRESSED PREDOMINAUTLY IN THE RETINA. IN NORMAL EYES, FOUND IN THE INNER UVEAL MESHWORK REGION AND THE ANTERIOR PORTION OF THE MESHWORK. IN CONTRAST, IN MANY GLAUCOMATOUS EYES, IT IS FOUND IN MORE REGIONS OF THE MESHWORK AND APPEARED MORE INTENSIFULY THAN IN NORMAL EYES, REGARDLESS OF THE TYPE OR CLINICAL SEVERITY OF GLAUCOMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: LOCATED PREFERENTIALLY IN THE CILIARY ROOTLET AND BASAL BODY OF THE CONNECTING CILIUM OF PHOTORECEPTOR CELLS, AND IN THE ROUGH ENDOPLASMIC RETICULUM. ALSO SECRETED. ALTERNATIVE PRODUCTS: THE SHORT FORM MAY BE THE PRODUCT OF AN ALTERNATIVE INITIATION AT MET-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: MAY PARTICIPATE IN THE OBSTRUCTION OF FLUID OUTFLOW THE TRABECULAR MESHWORK. \dot{\phantom{M}}

PATHWAY: FINAL STEP OF KETOGENESIS AND LEUCINE CATABOLIS SUBUNIT: HOMODIMER.
SUBCELLULAR LOCATION: MITOCHONDRIAL MATRIX.
SUBCELLULAR LOCATION: MITOCHONDRIAL MATRIX.
TISSUE SPECIFICITY: FIBROBLASTS, LIVER AND LYMPHOBLASTS.
TISSUE SPECIFICITY: FIBROBLASTS, LIVER AND LYMPHOBLASTS.
DISEASE NOWN AS HYDROXYMETHYLGLUTARICACIDURIA (HMG) WHI
DISEASE KNOWN AS HYDROXYMETHYLGLUTARICACIDURIA (HMG) WHI
LEAD TO HYPOGLYCEMIA AND COMA.
SIMILARITY: BELONGS TO THE HMG-COA LYASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                       J. Hum. Genet. 62:295-300(1998).
CATALYTIC ACTIVITY: (S)-3-HYDROXY-3-METHYLGLUTARYL-COA - ACETYL-COA + ACETOACETATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KITYKYTGKGI

Title:
Perfect score:
Sequence: US-08-991-628-2 78 1 FGIFVVDKNTGDINI 15

Scoring table: BLOSUM62

Searched:

188963 seqs, 23686106 residues

Database : A\_Geneseq\_36:\*

Word size : 0

Number of hits that pass the threshold :

188963

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Self epitope of desmoglein 3, implicated in autoimmune disease. Tolerisation; self-epitope; antigen; autoimmune disease; autoantigen; HA, human leukocyte antigen; T-cell; thymocyte; pemphigus vulgaris; desmoglein; multiple sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  W04842 standard; peptide; 15 W04842;

DR MPI; 96-045392/05.

Pr Anti-Interepldermal cellular antibody-combining peptide - which can per be immobilised on column to form adsorbent useful for treating diseases related to the antibody related to the antibody related to the antibody related to the antibody related to the sequence valual aspectife for properties are disclosed which contain at least 5 contiguous amino acids from the sequence valual spile aspectife properties are disclosed which containing more than 50 residues. The peptide combines with anti-interepidermal cellular antibody. It can be immobilised on a carrier to prepare an absorbent useful for the treatment of diseases related to anti-interepidermal cellular antibody. The present sequence is a specific example of the new peptides.

Antibody reactive with part of desmosomal cadherin - exposed on PT surface of epithelial or carcinoma cells, not bound to desmosomes, PT surface of epithelial or carcinoma cells, not bound to desmosomes, PT useful for diagnosis and treatment of carcinoma micrometastases PS Claim 7; Page 5; Bpp; German.

CC desmoglein begg, which is exposed on the surface of epithelial or CC carcinoma cells and not bound to desmosomes. An antibody (Ab) CC directed against epitopes of the present sequence can be used to CC diagnose, i.e. to detect carcinoma cells, especially comicrometastases, not bound to desmosomes. An antibody and CC datect living or fixed carcinoma cells by cell sorting methods and CC as a therapeutic to deliver agents, e.g. other Ab or toxins, to CC carcinoma cells. The Ab provides rapid and reliable detection of constants of carcinoma. And detects parts of DC that are not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 82.

Example'2; Page 5; 7pp; Japanese.

New peptides are disclosed which contain at least 5 contiguous amino acids from the sequence Val Gly Ile Asp Gln Pro Pro Phe Gly Ile Phe Val Val Asp Lys Asn Thr Gly Asp Ile Asn Ile Thr Alla Ile Val Asp Arg Glu Glu (see R93960), the peptide not containing more than 50 residues. The peptide combines with anti-interepidermal cellular antibody. It can be immobilised on a carrier to prepare an absorbent useful for the treatment of diseases related to anti-interepidermal cellular antibody. The present sequence is a specific example of the new peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Segment of desmosomal cadherin, desmoglein Dsg2.

Pemphigus foliaceus antigen-IgG constant region fusion protein - lini through the hinge region used to treat pemphigus foliaceus (laim 1, page 10-12; 17pg; Japanese.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiormis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is protein is useful to treat pemphigus foliaceus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 J09077800-A.

Anti-interepidermal cellular antibody-combining peptide - which can be immobilised on column to form adsorbent useful for treating diseases related to the antibody.

Example 3; Page 5; 7pp; Japanese.

New peptides are disclosed which contain at least 5 contiguous amino acids from the sequence Val Gly Ile Asp Gln Pro Pro Phe Gly Ile Phe Val Val Asp Tys Asn Thr Gly Asp Ile Asn Ile Thr Alla Ile Val Asp Arg Glu Glu (see R93960), the peptide not containing more than 50 residue The peptide combines with anti-interepidermal cellular antibody. It
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W15489
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for detecting
in immunodiagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        especially administered through an adsorbent upon which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphisus foliaceus antibodies which is useful in immunodiagnosis. The fusion protein has little or no side effection immunodiagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W15489
                                                                                                                                                                                                                                                                    18-MAY-1994; 129556.

The present sequence is full length human cadherin-13, which is a Ca2+ dependent cell adhesion protein. The human cadherin cDNA is a solated from a foetal brain cDNA library, using probes based on homologous rat cadherin cDNA.

Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FIT Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
FI Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
CC This sequence represents human cadherin-13. The invention specifically
CC provides details of human cadherin-5, -8, -11, -12 and -13, and rat
CC cadherin-8, -5, -11 and -13. Cadherins are calcium-dependent cell
CC adherin-8 red in the part of the cadherin proteins. They are glycosylated integral membrane proteins
CC that have an N-terminal extracellular domain that determines binding
CC specificity, a hydrophobic membrane spanning region and a C-terminal
CC specificity, a hydrophobic membrane spanning region and a C-terminal
CC cytoplasmic domain, which is highly conserved among members of the
CC superfamily. The C-terminal domain interacts with the cytoskeleton
CC novel cadherin sand other cytoskeleton-associated proteins. The
CC cadherins in various cancers. Sequence analysis of the cadherin
CC cadherins in various cancers. Sequence analysis of the cadherin
CC cadherins in various cancers. Sequence analysis of the cadherin
CC cadherins also allows investigation of the structure and function of
CC cadherin. The cadherin proteins may be isolated by using anti-cadherin
CC cantibodies. These antibodies may also be used to modulate the activity
CC of cadherin and to determine the tissue specific distribution of cadherin
CC proteins. Each subclass of cadherins has a unique tissue distribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

(DOHE-) DOHENY EYE INST.
The present sequence is a putative human cadherin-12, which is a Ca2+ dependent cell adhesion protein. The human cadherin cDNA was isolated from a foetal brain cDNA literary, using probes based on homologous rat cadherin cDNA.

Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

                                                                                                                                                                                                                                                                                                                                                                                                 adhesion proteins. They are glycosylated integral membrane proteins that have an N-terminal extracellular domain that determines binding specificity, a hydrophobic membrane spanning region and a C-terminal cytoplasmic domain, which is highly conserved among members of the superfamily. The C-terminal domain interacts with the cytoskeleton through eatenins and other cytoskeleton-associated proteins. The novel cadherin proteins may be used in the analysis of the role of cadherins in various cancers. Sequence analysis of the cadherin proteins also allows investigation of the structure and function of cadherin. These antibodies may be isolated by using anti-cadherin antibodies. These antibodies may also be used to modulate the activity of cadherin and to determine the tissue specific distribution of cadherin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB; T85404.

binding to various extracellular components. Each integrin receptor is a heterodimer comprised of an alpha and a beta subunit. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions to this rule. These integrins correspond to the laminin receptor. The cytoplasmic domain of the 6A and 6B integrins differs from previously isolated alpha 6 integrins. The human alpha 6B was isolated from human choriocarcinoma cell line JAR

N. PSDB; Q65673.

Integrins are neterodimers comrised of alpha beta4 cell surface protein Example 5; Figure 6; 34pp; English.

Integrins are heterodimers comrised of alpha and beta subunits, that care non-covalently associated transmembrane glycoproteins. In alpha chains and 6 beta chains have been recognised in man. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions. Integrins mediate (in part) the interaction of cells with the extracellular matrix, forming a link between the extracellular matrix and the cytoskeleton. They may transmit signals from the extracellular to the intracellular environment, affecting cell behaviour. This sequence is the alpha6 subunit of an alpha6 beta4 integrin.
                                                                                                               Query Match
